

SmartGrip

Cleaning and Maintenance

Attention Tilers

For tiles manufactured with our SmartGrip technology, a thorough grout cleaning process is highly recommended.

When Grouting:

1. It is important to start wiping off excessive grout approximately 15 minutes after application or when grout begins to harden.
2. A water change should be conducted every 4m². This helps to remove the polymer from grouting, which causes dirt and debris sticking to the tile surface.
3. A microfibre cloth is recommended to be used to buff-off grout residue after the surface becomes dry.
4. A grout haze cleaner is recommended to be used with a Melamine sponge (Magic Sponge) if there is still grout haze or other stubborn marks after the above process.

General Cleaning and Maintenance:

1. It is highly recommended to vacuum all dust and dirt before cleaning with water.
2. A microfibre cloth and mop can be used for general cleaning.
3. If there is any stubborn marks remaining, we recommend spraying water onto the tile surface and using a Melamine sponge (Magic Sponge) to buff the surface.
4. Mop up any excessive water.

Please Note:

Should you find other substances difficult to remove, or have other questions regarding the product, please contact your tile supplier for further assistance.
